

GUPPY BRIEFS #16

Potassium Permanganate 99 % (Eliminating Snails and Odor in the Aquarium)

Frank Schulterbrandt 2/2/2017

Potassium Permanganate 99 % :: usage to eliminate snails, odors in the aquarium, etc. Looks like gun powder. This product must be used in minute quantities. Two to three granules will turn your water to a lite purple coloring... You have overdosed your tank if the water turns a dark purple and an immediate water change is necessary. You should first try this out on one tank only. Try putting in 3 granules first then stir the water around. If the water in the tank does not turn to a very lite purple then add 2 more granules as it is needed.

Snails: This will eliminate snails and eggs from the aquarium. A follow up treatment should be done. This is an inexpensive product but can be deadly to your aquarium fish if not administered correctly. This product must not be allowed to come in contact with your skin / eyes and must not be inhaled...

Odors in the aquarium will be eliminated if use the same way as the treatment for snails. Sometimes water changes cannot eliminate the smell in the tank, unless a complete breakdown is performed on the tank... Gravel, filters, water, this can lead to water cycling problems. Potassium Permanganate is the solution without upsetting the biological water chemistry that could be harmful to your fish(if used lightly). In heavier dosages it will kill everything in the tank. As a precaution perhaps your filtering media should be removed temporally

Other uses for this product : Plant Disinfection ,Tank Treatment, Fish Treatment , etc.
